

PORT OF BROWNSVILLE PUBLIC NOTICE FOR EXCESSIVE WATER FLOWS FROM THE TURNING BASIN PLANT

Due to severe rainfall that affected our area between July 1-2, 2025, the Turning Basin wastewater treatment plants located at the Port of Brownsville were unable to properly treat the domestic wastewater they receive from the collection system.

During this 48-hour period, approximately 393,590 gallons of partially treated wastewater were discharged into the Brownsville Ship Channel. This volume exceeded the permitted amount for the treatment facilities affected during the weather event.

The Port of Brownsville initiated cleaning efforts in the affected area and is working closely with the Texas Commission on Environmental Quality (TCEQ) to monitor the water quality in the channel. Both treatment plants are now operating normally.

We advise the public to avoid contact with water from the ship channel at the Turning Basin due to the potential of discharge water.

This notification is being issued under the guidance of TCEQ in accordance with Title 30, Texas Administrative Code (TAC 30) Section 319.302

The Port of Brownsville remains committed to ensuring a safe and sustainable environment for the communities and businesses we serve.
